

a Publication status across the rurality gradient

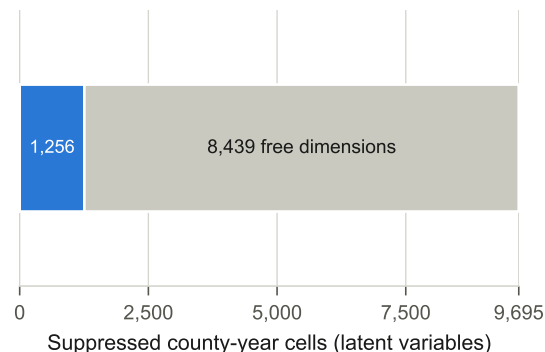

b One county: Clarke County, Alabama

The 1–9 bounds alone admit 59,049 integer allocations. The published six-year total of 11 cuts that to 210 (281x fewer) and tightens every suppressed year to 1–7 (solid, against the pale published bound). Setting each suppressed year to 5 would imply 25 deaths; dropping them entirely would imply 0.

c What the public equalities pin down

1,733 nominal equalities reduce to 1,256 independent rows: 467 carry no information and 10 are algebraically implied. They fix 13% of the latent dimensions, so the public constraints bound the suppressed counts without identifying them.
